Top Ten Steps for a Successful Portable QRP Operation
By , Paul Signorelli, W0RW

1. Propagation and Band Activity

When you operate QRP portable you want to work as many people as possible so the band conditions must be good. This means that you have to keep track of the propagation conditions before planning an operation. I try to look for propagation predictions for the band I plan to operate on but they are not very reliable. I check the QSL Net propagation site at http://dx.qsl.net/propagation

The flux has been up up recently but we still see seasonal variations. Ten meters was great in the fall but now in the winter it is pretty bad. So 15 meters and 17 meters can be the best bands for DX if 10 meters is dead. This is always changing, so before I pick a date to operate, I monitor the bands at the same time that I plan to operate. The Absorption Index is also a key factor, operating when the "A" Index is above 6 is difficult. I also use the NCDXF beacons see: http://www.ncdxf.org/beacon/beaconschedule.html

Trenton Military (15034 kHz) or CHU (14670 kHz) for 20 meter propagation checks. Coastal stations might use WWV/WWVH. 20 meters is best for day time country wide propagation. 40 and 80 meters are good for night time operation. I always try to avoid contests and other busy periods. Checking the QST Contest Calendar helps to insure the band is going to be clear. Check your desired frequency in advance, you don't want to pick a frequency that is used for nets, traffic handling or RTTY.

2. Weather Conditions

The weather forecasting is really good, so this is easy. Try http://www.wunderground.com/

I look for warm temperatures and no wind. Check your local web cam. Even Pikes Peak has a weather station and a Panoramic HD web cam.

See http://www.springsgov.com/units/pikespeak/index.asp

3. Honey Doo Items

Always check the XYL's honey doo list and make sure you are clear for the day.

4. Location and Road Conditions

Try a your local National Park http://www.nps.gov/findapark/index.htm
If you are an Old Timer you can get a lifetime Pass. Always check the road and site conditions before going out in the field. You don't want to drive hundreds of miles to find out that the Capulin Volcano road is closed by snow. Canyon roads can have snow or land slides. Even Pikes Peak can be closed or have a delayed opening and prevent you from getting to your desired operating location on time. Pick an open space operating site, canyons are not good for QRP operating.
You might need trees for hanging an antenna or if you are going to operate Pedestrian Mobile with a whip you will want to find trails that don't have a lot of over hanging, antenna eating braches.

5. Equipment Readiness

You need to check out your equipment right before you head out to your operating site. This prevents leaving behind some critical item. Needless to say, you should have your antenna all pre-tuned before you leave. My radio is always mounted to a backpack and is always ready to go. The LiIon battery is always charged, but I always take a spare. I just need to put the backpack into the car, with the antenna and counterpoise. The accessories are also checked: microphone, earphones, key, SWR meter, adapters, pen, log, watch, hat, gloves, coat, etc. Make an equipment checklist. It is good to have a spare accessory batteries, a spare radio and duct tape for contingencies.

6. Vittles
I take water, lunch and my VHF HT in a fanny pack.

7. Operating Announcements

I try to post my operations on the reflectors a day before the operation. When you post too far in advance, people forget and when you post right before the operation, some people don't get the notice until after your are finished. I always try to be on my exact posted frequency (or alternate) at the exact time so people don't get stood up. Posting your operating times gives you more Q's. It is no fun running your battery down calling CQ with no responses. QRPspots, HFnow, GORC, QRP-L, SOTA Summits are good places to list your operation, as appropriate. Post your schedule in GMT (Universal Time/Zulu time) as well as your local time. Also post details about your operating location, links to pictures, trail maps, QSL Information, will be helpful, etc.

8. Prep Your Vehicle

Put gas in your tank!

9. Initial set up

When I arrive at my operating site, I set up my rig, attach the antenna, and check power and my operating frequency. When operating Pedestrian Mobile, I tune my whip and dragwire, put on my backpack and I am ready for the trail.
10. Safety
Always be prepared for adverse conditions. You might need rain gear, snake proof boots, etc. Always give someone your travel plans. Take your cell phone or an HT that will hit a repeater.

For more detailed information get:
WA3WSJ's new Amateur Radio Pedestrian Mobile Radio Handbook that can be downloaded for free in the Library.

That's it, the Top Ten Steps for QRP portable operating.

If you are addicted to QRP, you can consider this your 10 Step Program.
